"I pledge my honor that I have abided by the Stevens Honor System."

Point values are assigned for each question.

Points earned: ____ / 100

1. Consider the algorithm on page 148 in the textbook for Binary Reflected Gray Codes. What change(s) would you make so that it generates the usual binary numbers **in order** for a given length n ? Your algorithm must be recursive and keep the same structure as the one in the textbook. Describe only the change(s). (10 points)

ALGORITHM *BRGC*(n)//Generates recursively the binary reflected Gray code of order n //Input: A positive integer n //Output: A list of all bit strings of length n composing the Gray code**if** $n = 1$ make list L containing bit strings 0 and 1 in this order**else** generate list $L1$ of bit strings of size $n - 1$ by calling *BRGC*($n - 1$) copy list $L1$ to list $L2$ in reversed order add 0 in front of each bit string in list $L1$ add 1 in front of each bit string in list $L2$ append $L2$ to $L1$ to get list L **return** L

To generate the usual binary numbers in order I would copy list $L1$ to list $L2$ in order rather than in reversed order.

2. Show the steps to multiply 72×93 with Russian peasant multiplication, as seen in Figure 4.11b on page 154 in the textbook. (10 points)

Answer: 6696

3. Suppose you use the `LomutoPartition()` function on page 159 in the textbook in your implementation of Quicksort. (10 points, 5 points each)

FIGURE 4.13 Illustration of the Lomuto partitioning.

element in the first segment, swapping $A[i]$ and $A[s]$, and then incrementing i to point to the new first element of the shrunk unprocessed segment. After no unprocessed elements remain (Figure 4.13b), the algorithm swaps the pivot with $A[s]$ to achieve a partition being sought (Figure 4.13c).

Here is pseudocode implementing this partitioning procedure.

ALGORITHM *LomutoPartition*($A[l..r]$)

```
//Partitions subarray by Lomuto's algorithm using first element as pivot
//Input: A subarray  $A[l..r]$  of array  $A[0..n-1]$ , defined by its left and right
//       indices  $l$  and  $r$  ( $l \leq r$ )
//Output: Partition of  $A[l..r]$  and the new position of the pivot
 $p \leftarrow A[l]$ 
 $s \leftarrow l$ 
for  $i \leftarrow l+1$  to  $r$  do
    if  $A[i] < p$ 
         $s \leftarrow s+1$ ;  $\text{swap}(A[s], A[i])$ 
 $\text{swap}(A[l], A[s])$ 
return  $s$ 
```

How can we take advantage of a list partition to find the k th smallest element in it? Let us assume that the list is implemented as an array whose elements are indexed starting with a 0, and let s be the partition's split position, i.e., the index of the array's element occupied by the pivot after partitioning. If $s = k - 1$, pivot p itself is obviously the k th smallest element, which solves the problem. If $s > k - 1$, the k th smallest element in the entire array can be found as the k th smallest element in the left part of the partitioned array. And if $s < k - 1$, it can

- a) Describe the types of input that cause Quicksort to perform its worst-case running time. Explain why these types of input cause the worst-case.

In the worst case each partition results in a very unbalanced partitioning of the array where one segment has size $n - 1$ and the other segment has size zero, this happens if the array is already sorted in non-decreasing order or non-increasing order.

- b) What is that worst-case running time?

The worst case running time is $\Theta(n^2)$

4. Compute 2205×1132 by applying the divide-and-conquer Karatsuba algorithm outlined in the text. Repeat the process until the numbers being multiplied are each 1 digit. For each multiplication, show the values of c_2 , c_1 , and c_0 . Do not skip steps. (10 points)

So below is the definition of the Karatsuba Algorithm. Let's call:

$$c_0 = a_0 * b_0$$

$$c_1 = (a_1 + a_0) * (b_1 + b_0)$$

$$c_2 = a_1 * b_1$$

Then we have:

$$a * b = c_2 * B^n + (c_1 - c_2 - c_0) * B^{(n/2)} + c_0$$

2205 and 1132

$A_1 = 22$ and $A_0 = 05$ $B_1 = 11$ and $B_0 = 32$

$$C_0 = 5 * 32 = 160$$

$$A = 05 = 0 * 10 + 5$$

$$A_1 = 0, A_0 = 5$$

$$B = 32 = 3 * 10 + 2$$

$$B_1 = 3, B_0 = 2$$

$$C_0 = 5 * 2 = 10$$

$$C_1 = 5 * 5 = 25$$

$$C_2 = 0 * 3 = 0$$

$$A * B = 0 * 100 + (25 - 0 - 10) * 10 + 10 = 150 + 10 = 160$$

$$C_1 = (22 + 5) * (11 + 32) = 27 * 43 = 1161$$

$$A = 27 = 2 * 10 + 7$$

$$A_1 = 2, A_0 = 7$$

$$B = 43 = 4 * 10 + 3$$

$$B_1 = 4, B_0 = 3$$

$$C_0 = 7 * 3 = 21$$

$$C_1 = 9 * 7 = 63$$

$$C_2 = 2 * 4 = 8$$

$$A * B = 8 * 100 + (63 - 8 - 21) * 10 + 21 = 1161$$

$$C_2 = 22 * 11 = 242$$

$$A = 22 = 2 * 10 + 2$$

$$A_1 = 2, A_0 = 2$$

$$B = 1 * 10 + 1$$

$$B_1 = 1, B_0 = 1$$

$$C_0 = 2 * 1 = 2$$

$$C_1 = 4 * 2 = 8$$

$$C_2 = 2 * 1 = 2$$

$$A * B = 2 * 100 + (8 - 2 - 2) * 10 + 2 = 242$$

$$A * B = 242 * 10000 + (1161 - 242 - 160) * 100 + 160$$

$$\begin{aligned}
 &= 242 * 100000 + 759 * 100 + 160 \\
 &= 2420000 + 75900 + 160 \\
 &= \mathbf{2496060}
 \end{aligned}$$

5. Draw the binary search tree after inserting the following keys: 24 18 67 68 69 25 19 20 11 93 (10 points)

6. Consider the following binary tree. (16 points, 2 points each)

- Traverse the tree preorder.
10,8,5,3,5,2,1,7,1,6
- Traverse the tree inorder.
3, 5, 5, 8, 1, 2, 10, 1, 7, 6
- Traverse the tree postorder.
3, 5, 5, 1, 2, 8, 1, 6, 7, 10
- How many internal nodes are there?
5 internal nodes
- How many leaves are there?
5 leaves
- What is the maximum width of the tree?
4 is the maximum width of the tree

g) What is the height of the tree?

3 is the height of the tree

h) What is the diameter of the tree?

5 is the diameter of the tree

7. Use the Master Theorem to give tight asymptotic bounds for the following recurrences. (25 points, 5 points each)

a) $T(n) = 2T(n/4) + 1$

$A = 2, B = 4, d = 0$

$a > b^d$ so $\theta(n^{\log_4 2}) = \theta(n^{1/2})$

b) $T(n) = 2T(n/4) + \sqrt{n}$

$A = 2, B = 4, d = 1/2$

$a = b^d$ so $\theta(\sqrt{n} \log_4 n)$

c) $T(n) = 2T(n/4) + n$

$A = 2, B = 4, d = 1$

$a < b^d$ so $\theta(n^1)$

d) $T(n) = 2T(n/4) + n^2$

$A = 2, B = 4, d = 2$

$a < b^d$ so $\theta(n^2)$

e) $T(n) = 2T(n/4) + n^3$

$A = 2, B = 4, d = 3$

$a < b^d$ so $\theta(n^3)$

8. Consider the following function. (9 points)

```
int function(int n) {
    if(n <= 1) {
        return 0;
    }
    int temp = 0;
    for(int i = 1; i <= 6; i++) {
        temp += function(n / 3);
    }
    for(int i = 1; i <= n; i++) {
        for(int j = 1; j * j <= n; j++) {
            temp++;
        }
    }
}
```

```

    }
    return temp;
}

```

- a) Write an expression for the runtime $T(n)$ for the function (with the correct asymptotic symbol for the $f(n)$ part of the relation). (4 points)

$$T(n) = 6T(n/3) + \theta(n\sqrt{n})$$

- b) Use the Master Theorem to give a tight asymptotic bound. Simplify your answer as much as possible. (5 points)

$$A = 6, B = 3, d = 3/2$$

$$a > b^d \text{ so } \theta(n^{\log_3 6})$$
